Heuristic Evaluation

- Improve User Control and Freedom
 - <u>UI Bug:</u> Since most web pages are long and require scrolling to view different parts of
 information, users might get stuck and feel frustrated when they reach the bottom of a
 web page, where no navigation buttons or path is available.
 - o <u>Solution</u>: Provide a "Back to Top" button at the bottom of each web page, so users have a clearly marked "exit" for taking a step back, fostering a sense of freedom and confidence.

Before After

- Improve Consistency and Standards
 - <u>UI Bug:</u> Two different fonts were used without following a consistent standard between the web pages, which may frustrate users when scanning for information.
 - Solution: Use "Courier Prime" (a display font) for texts that are big and easy to read and "Inter" (which has a uniformed stroke width) for texts that are small and complicated, so consistency in font is maintained within and across different pages.

Before After

- Improve Help and Documentation
 - <u>UI Bug:</u> In order to complete the questionnaire on the home page, users have to choose a
 weight range for their dogs, which can be difficult without additional help or guidance.
 - Solution: Add an icon for accessing additional information next to the weight range question, so when hovering over, users can see a visual chart that helps them complete the required task.

Implementation Challenges or Bugs

- Determining a clear site structure
 - o I started with writing the HTML and CSS parts separately and found it super hard to structure my HTML pages without knowing how to style them. I had trouble determining when to use <section>, <div>, or for organizing my content. I had finally overcome this challenge by realizing that I should write the HTML and CSS parts together. Once I had a high-level plan for how to style the pages, it became clear to me which containers I should use in my HTML. By constantly switching between the two parts and checking their resulting pages, I was also able to discover and fix bugs more quickly along the way.
- Implementing a grid system in CSS
 - Before writing this assignment, I had only used basic CSS layout properties such as position and float in my previous web programming projects. So I had trouble envisioning

how to bring the grid system I used in my Figma prototype to my implementation of the web pages. After performing some research online, I discovered CSS flexbox layout and spent some time learning about how it works. Finally, I was able to overcome this challenge by using this new layout system for organizing and aligning my product images and descriptions.

Brand Identity - Calming and Fun!

- I intended to design a shopping experience that is both relaxing and fun for pet owners who are planning to take their animal pals to the wild for an adventure. I wanted the customers to feel both engaged and unrushed as they browse through products on the website. In order to achieve these goals, I chose a minimalist style for page layout and a color palette that evokes a sense of nature. I also purposefully left many whitespaces across the web pages so users' eyes would not feel busy or overwhelmed.
- Overall, I believe that it is important to establish an engaging yet soothing shopping experience
 for establishing a brand identity that cares and empathizes with our customers. So many other
 online pet-stores nowadays lack this and throw massive amounts of information to users' faces at
 once.
